## 3. Systematic Mapping process

We applied the systematic mapping methodology presented in [1] to our study on SLA-guided data integration on a multi-cloud environments. The proposed methodology consists in five steps (in which step has a result and the final one is the mapping):

**Definition of research question** to define the *research scope*;

**Conduct search** in order to retrieve *all candidate papers*. Those papers are selected applying a query which express the research interest to scientific databases;

**Screening of papers** to select the *relevant papers* to answer the research question based on a inclusion and exclusion criteria;

**Keywording using abstracts** to identify terms that helps on developing the *classification scheme* (mapping categories to classify the papers); and

**Data extraction and mapping process** to sort the relevant papers into the mapping categories and produce the systematic mapping.

The following subsections describes our first to fourth step in the mapping. The systematic mapping results are presented in the next section.

### 3.1. Definition of research questions (RQs)

The aim of this work is to identify in the literature how has *SLA-guided data integration on a multi-cloud environments* been explored, discover possible gaps and the main results produced. In order to achieve this goal we formulated three research questions:

**Which are the SLA measures that have been applied most in the cloud?**

**How has the publication of papers on data integration involved towards cloud topics?**

**How and in which context have data integration guided by QoS models or requirements been explored in the literature?**

### 3.2. Search and screening of papers

search string...

inclusion and exclusion criteria...

Inclusion: The title and the abstract mention (i) approach using SLA which includes (or doesn't) data integration; (ii) any study regarding SLA in the context of cloud computing (I saw that there are some works on voip services. I believe this is out of our scope) or some improvement to SLA; (iii) data integration in the context of cloud computing; and (iv) QoS efforts regarding data integration;

A new version of our exclusion criteria:

Papers, books and others that the subject do not focus on the following topics must be excluded: (i) an approach combining SLA, data integration and cloud and multi-cloud; (ii) an approach using SLA contracts in the context of cloud and multi-cloud; (iii) an approach applying some improvement to SLA; (iv) a data integration approach in the context of cloud and multi-cloud; and (v) a QoS approach regarding data integration.

### 3.3. Keywording of abstracts

small introduction...facets...

**Data Integration Environment facet** represents the environment (architecture and deployment) in which data integration is being applied. The dimensions to this facet are: *Cloud*, *Data Warehouse*, *Federated Database* and *Multi-cloud*.

Table 1: Caption here...

Dimension	Publication
Cloud	
Data Warehouse	
Federated Database	
Multi-cloud	

**Data Integration Description facet** indicates the strategy used by authors in order to achieve data integration. The dimensions to this facet are: *Knowledge*, *Metadata* and *Schema*.

Table 2: Caption here...

Dimension	Publication

Metadata	
Schema	

**Data Quality facet** shows the data quality parameters applied in the publication. The dimensions are: *Confidentiality*, *Privacy*, *Security*, *SLA* (a publication is classified in this dimension when it does not focus on a specific quality parameter, but in general uses a SLA contract in order to specify one or more), *Data Protection*, *Data Provenance* and *Others*.

**SLA facet** is devote to present the main focus of how the SLA is used in the publication. *Language*, *Model*, *Resources* and *Security*.

**Contribution facet** express the main publication contribution. The dimensions are *Tool*, *Literature Analysis*, *Method*, *Model*, *Process* and *Extended Study*.

**Research facet** is dedicated to classify in which kind of research the publication can be fitted in. The dimensions to this facet are: (i) *Evaluation research* ; (ii) Validation research; (iii) Solution proposal; and (iv) Opinion.
